

**Nuclear Advocacy Through
Grassroots Education**

US Nuclear Energy Foundation

“Think About It”

We cannot energize our future by demonizing our energy of the past or demonizing our energy of the future. Thus, coordinating, cooperating and integrating all forms of energy generation is the only way to solve our growing energy needs.

Most of us establish our opinion about topics based on only a small percentage of the subject matter of

the dialogue. In the context of energy, the players are naturally engrossed in their

specialty, be it wind, solar, geothermal, nuclear, coal, tidal, natural gas, etc. Our challenge to the science and engineering community is to maximize the cost efficiency of energy generation to a wholesale production cost of 4¢ to 8¢ per kilowatt hour. The only way we can compete with worldwide industrial manufacturing is to reduce our energy costs at ALL levels nationwide.

Knowledge of the cost effective value of energy must become a “national initiative” in public education and through grassroots educational foundations like USNEF.

We urge you to get involved for our future and our children and grandchildren’s future. Industry cannot educate the grassroots public alone. We have to become more accountable for our self knowledge of worldwide events and energy sources.
